 This book concerns the problem of evolution of a round oil spot surrounded by water when oil is extracted from a well inside the spot. It turns out that the boundary of the spot remains an algebraic curve of degree four in the course of evolution. This curve is the image of an ellipse under a reflection with respect to a circle. Since the 1940s, work on this problem has led to generalizations of the reflection property and methods for constructing explicit solutions. More recently, the results have been extended to multiply connected domains. This text discusses this topic and other recent work in the theory of fluid flows with a moving boundary. Problems are included at the end of each chapter, and there is a list of open questions at the end

of the book.

This valuable resource provides an overview of recent research and strategies in developing and applying modelling to promote practice-based research in STEM education. In doing so, it bridges barriers across academic disciplines by suggesting activities that promote integration of qualitative science concepts with the tools of mathematics and engineering. The volume's three parts offer a comprehensive review, by 1) Presenting a conceptual background of how scientific inquiry can be induced in mathematics classes considering recommendations of prior research, 2) Collecting case studies that were designed using scientific inquiry process designed for math classes, and 3) Exploring future possibilities and directions for the research included within. Among the topics discussed: · STEM education: A platform for multidisciplinary learning. · Teaching and learning representations in STEM. · Formulating conceptual framework for multidisciplinary STEM modeling. · Exploring function continuity in context. · Exploring function transformations using a dynamic system. Scientific Inquiry in Mathematics - Theory and Practice delivers hands-on and concrete strategies for effective STEM teaching in practice to educators within the fields of mathematics, science, and technology. It will be of interest to practicing and future mathematics teachers at all levels, as well as teacher educators, mathematics education researchers, and undergraduate and graduate mathematics students interested in research based methods for integrating inquiry-based learning into STEM classrooms.

Manufacturing Engineering John Wiley & Sons

In the first, 1986, edition of this book, inverse problems in vibration were interpreted strictly: problems concerning the reconstruction of a unique, undamped vibrating system, of a specified type, from specified vibratory behaviour, particularly specified natural frequencies and/or natural mode shapes. In this new edition the scope of the book has been widened to include topics such as isospectral systems- families of systems which all exhibit some specified behaviour; applications of the concept of Toda flow; new, non-classical approaches to inverse Sturm-Liouville problems; qualitative properties of the modes of some finite element models; damage identification. With its emphasis on analysis, on qualitative results, rather than on computation, the book will appeal to researchers in vibration theory, matrix analysis, differential and integral equations, matrix analysis, non-destructive testing, modal analysis, vibration isolation, etc. "This book is a necessary addition to the library of engineers and mathematicians working in vibration theory." Complex Adoption and Assisted Reproductive Technology Taylor & Francis

Carolyn Price investigates what it means to say that mental states -- thoughts, wishes, perceptual experiences, and so on -- are about things in the world. Her answer to this deep philosophical problem is a novel teleological account of intentional content, grounded in and shaped by a carefully constructed theory of functions. Price's teleological account centres on the claim that the content of an intentional state depends both on the information that it is supposed to carry and on the way in which it is used -- whether to trigger a simple response, to help keep track of an object or place, to help in planning a route through the environment, or in a sophisticated process of reasoning. Along the way she defends her view from recent objections to teleological theories, and indicates how it might be applied to some notable problems in the philosophy of mind. *Functions in Mind* is an adventurous contribution to the project of bringing together philosophy and biology in order to understand the mind as part of the natural world.

The Sentinel Method and Its Application to Environmental Pollution Problems Springer Science & Business Media

Many environmental problems contain incomplete data in the initial or boundary conditions. How do we solve problems for which some of the initial and/or boundary conditions are unknown? Using a new technique, the sentinel method, this book answers these questions and others as they pertain to inverse problems in environmental pollution, such as pollution of underground and surface waters, thermal pollution, and air pollution.

Decades of research have demonstrated that the parent-child dyad and the environment of the family—“which includes all primary caregivers”—are at the foundation of children's well-being and healthy development. From birth, children are learning and rely on parents and the other caregivers in their lives to protect and care for them. The impact of parents may never be greater than during the earliest years of life, when a child's brain is rapidly developing and when nearly all of her or his experiences are created and shaped by parents and the family environment. Parents help children build and refine their knowledge and skills, charting a trajectory for their health and well-being during childhood and beyond. The experience of parenting also impacts parents themselves. For instance, parenting can enrich and give focus to parents' lives; generate stress or calm; and create

any number of emotions, including feelings of happiness, sadness, fulfillment, and anger. Parenting of young children today takes place in the context of significant ongoing developments. These include: a rapidly growing body of science on early childhood, increases in funding for programs and services for families, changing demographics of the U.S. population, and greater diversity of family structure. Additionally, parenting is increasingly being shaped by technology and increased access to information about parenting. *Parenting Matters* identifies parenting knowledge, attitudes, and practices associated with positive developmental outcomes in children ages 0-8; universal/preventive and targeted strategies used in a variety of settings that have been effective with parents of young children and that support the identified knowledge, attitudes, and practices; and barriers to and facilitators for parents' use of practices that lead to healthy child outcomes as well as their participation in effective programs and services. This report makes recommendations directed at an array of stakeholders, for promoting the wide-scale adoption of effective programs and services for parents and on areas that warrant further research to inform policy and practice. It is meant to serve as a roadmap for the future of parenting policy, research, and practice in the United States.

New pathways to parenthood are being traveled by growing numbers of couples and single adults, including many who face medical and social barriers to having children. From a psychological standpoint, families formed by complex adoption and assisted reproductive technology (ART) are first and foremost just that--families. Yet they also face a unique array of issues and challenges that may be clarified and resolved in the therapeutic setting. This much-needed book provides a deeper understanding of the ways that complex adoption and ART shape the life experience of children and parents, identifying important areas and methods for assessment and treatment. Combining developmental and ecological research with in-depth case material, the book establishes an integrative framework for clinical practice. The authors draw upon knowledge and skills gained from working in a variety of new family contexts. In the area of adoption, many new options have evolved that differ from traditional practices of adoption at birth. Thousands of older children in foster and institutional care in the United States and abroad are awaiting permanent placements. Open adoption, kinship adoption, and transracial adoption are also transforming family life, as is the use of ART, which raises significant issues of family identity and family process. The book explores such key themes as the significance of early experience, the capacity to recover from exposure to trauma, the impact of heredity and the difference that environment can make, and the centrality of primary attachment relationships. Also discussed are the impact of bias and other issues affecting families of difference, including lesbian and gay families. Concluding chapters consider promising future directions for training and research. This is an important resource for social workers, family therapists, clinical psychologists, psychiatrists, and other professionals working with children and families, as well as researchers and students in these fields. It will serve as a text in advanced undergraduate and graduate-level courses.

8 Practice Tests for the SAT 2017 Lawrence Erlbaum Associates

Manufacturers are becoming more aware of human factors in product design as a major competitive issue. In many product areas, manufacturers have reached a technology ceiling, which simply means that it is increasingly difficult to get ahead of the competition in terms of, for example, functionality, technical reliability or manufacturing costs. As a consequence, design has become a major battleground for manufacturers, and usability

is recognized as being a central tenet of good design. This book provides a unique snapshot of current practice in human factors, identifying methods and techniques that work well under tight constraints and providing case study evidence of their effectiveness. The commercial implications of usability are discussed, and special attention is paid to two key trends: inclusive design and smart products. Inclusive design is about meeting the needs of all users with one design, which includes the elderly and the disabled. Smart products are multi-functional products with electronic interfaces containing a vast array of "helpful" functions. Industrial designers and manufacturing executives will find this text enlightening.
