In 1993, a military court sentenced Alcide Nikopol to thirty years of suspended animation. In 2023, Nikopol is awakened, his body possessed by the Egyptian god Horus, on the run from his fellow gods. So begins the brilliant Nikopol Trilogy, the basis for Inki Bilal's film "Immortal," in which a political dissident deals with a government gone mad, a son he never knew who could now be his twin, a beautiful investigative reporter and a body-jumping Egyptian god.

This dark comedy takes place in a seedy motel room outside Oklahoma City, where Agnes, a drug-addled cocktail waitress, is hiding from her ex-con ex-husband. Her lesbian biker friend R.C. introduces her to Peter, a handsome drifter who might be an AWOL Gulf War veteran. They soon begin a relationship that takes place almost entirely within the increasingly claustrophobic confines of her motel room. Peter begins to rant about the war in Iraq, UFOs, the Oklahoma City bombings, cult suicides, and then secret government experiment on soldiers, of which he believes he is a victim. His delusions infect Agnes and the tension mounts as mysterious strangers appear at their door, past events haunt them at every turn and they are attacked by real bugs. Tracy Letts's tale of love, paranoia, and government conspiracy is a

thought-provoking psycho-thriller that mixes terror and laughter at a fever pitch.

Key features: Presents a brief history of past classifications, a summary of present classification, and speculation on how the classification may evolve in the future Includes keys for the identification of families and subfamilies of the Pentatomoidea and for the tribes in the Pentatomidae Explains transmission of plant pathogens and concepts of pathology and heteropteran feeding for the non-specialist Provides an extensive literature review of transmission by stink bugs of viral, bacterial, fungal, and protozoan organisms that cause diseases of plants Discusses the diversity of microbial symbionts in the Pentatomidae and related species, showing how microorganisms underpin the evolution of this insect group Reviews semiochemicals (pheromones, kairomones, allomones) of the Pentatomoidea and their vital role in the life histories of pest and beneficial species and their exploitation by natural enemies of true bugs Covers past, current, and future control options for insects, with a focus on stink bugs and related heteropterans The Superfamily Pentatomoidea (stink bugs and their relatives) is comprised of 18 families with over 8,000 species, the largest of which is the family Pentatomidae (about 5,000 species). These species primarily are phytophagous, and many cause tremendous economic damage to crops worldwide. Within this superfamily are six invasive species, two that occur worldwide and four that are recent invaders in North America. Once established in new geographic regions, these species have increased their numbers and geographic distributions dramatically, causing economic damage

totaling billions of dollars. *Invasive Stink Bugs and Related Species (Pentatomoidea): Biology, Higher Systematics, Semiochemistry, and Management* is the first book that presents comprehensive coverage of the biology of invasive pentatomoids and related true bug species and addresses issues of rapidly growing economic and environmental concerns. Containing the contributions of more than 60 stink bug specialists from 15 countries, this book provides a better understanding of the biology and economic importance of these invasive species, why they became invasive, and how their continued geographical expansion is likely to affect numerous agricultural systems and natural environments. Including over 3,500 references, this authoritative work serves as an access point to the primary literature on their life histories, higher systematics, diapause and seasonal cycles, pathogens, symbionts, semiochemistry, and pest management control strategies for pentatomoid bugs.

Plant bugs are not well known despite their economic importance, the large numbers found on the fruit crops, and the fact that they have been with us for a long time. This bulletin aims to help economic research scientists and fruit growers to identify the plant bugs found on the fruit crops and to provide information on their habits and biology. The 81 species collected represent approximately 6% of the total number of Miridae species believed to occur in Canada. Adults of most species treated here are illustrated, and male claspers of closely related species are figured. Brief descriptions of adults, biology, and distributions are included. Keys to subfamilies, genera, and species are also provided.

I hate camp. I just hate it. I wish I didn't. But I do. Being here is worse than bug juice on a burger. Or homework on Thanksgiving. Or water seeping into my shoes. In this sequel to *Like Pickle Juice on a Cookie*, Eleanor is off to summer camp. At first she's excited, but when she gets there she finds bugs, no electricity, and terrible food. And worst of all: swim class, where she just can't seem to keep up with the other campers. But as the days go by, Eleanor realizes that life is full of special surprises—even after some belly flops. Praise for *Like Bug Juice on a Burger* "Eleanor doesn't just survive, she grows...Readers will celebrate and look forward to more." —Kirkus Reviews "Sternberg gets all of the details exactly right, from the "orange, oozing sloppy joes" to the frustrations of trying to swim in a life jacket. susan dove lempke." —The HornBook "This is a really sweet novel in verse and a good sequel to *Like Pickle Juice on a Cookie* (Abrams, 2011), though it works fine as a stand-alone." —School Library Journal "Eleanor's tentative yet heartfelt voice comes through as clearly as in the first volume, with the short, ragged-right-margin lines as approachable as her personality. Sternberg is particularly deft at leaving young-reader-sized room for interpretation and extrapolation." —The Bulletin of the Center for Children's Books "This sequel to *Like Pickle Juice on a Cookie* (2011) is just as endearing and wise, illustrating how small triumphs can help children survive what, at the time, seems an insurmountable trial." —Booklist Award Bulletin of the Center for Children's Books Blue Ribbons List 2013 Honor list - 2014 Gryphon Award *Heteroptera of Economic Importance* Northwestern University Press

A revision and the first phylogenetic analysis of the widely

distributed plant bug genus *Tytthus* is presented. All 24 species of this genus, including five described as new, prey exclusively on planthopper (Delphacidae) eggs, making them of great importance on agricultural monocots. Two species have been used successfully in biocontrol programs to suppress populations of sugarcane delphacid on sugarcane and brown planthopper on rice. All species of *Tytthus* are relatively small, but the tiny brachypterous males of one species, ranging from 1.08-1.30 mm long, rank it as possibly the world's smallest known plant bug. Members of this genus are found in nearly all biogeographic regions, including 18 restricted to the Nearctic and Neotropics and three from the eastern Oriental and Indo-Pacific regions. There are also two Holarctic and one circumtropical (Afrotropical, Neotropical, and Oriental) species. A hypothesized relationship with several Nearctic plant bug genera suggests a New World origin for this group of important predatory bugs.

True bugs (Heteroptera) are a diverse and complex group of

plant-feeding and predatory insects important to food production, human health, the global economy and the environment. Within the nearly 43,000 species described around the world, Neotropical true bugs are particularly diverse, and much remains to be discovered about their biology and relations with other species. Inspired by the need for a comprehensive assessment, True Bugs (Heteroptera) of the Neotropics is the most complete and thorough review ever published. Experts in each of the seven infraorders have drawn together the scattered literature to provide detailed treatments of each major taxon. The most common and important species as well as select lesser known species in each major family are covered, highlighting morphology, classification, biology and ecology. The numerous color illustrations highlight key species and their adaptations, and importance to basic and applied sciences is discussed. Each chapter is based on an up-to-date review of the literature, and with a bibliography of more than 3,000 references, readers are presented with an unprecedented and vital and timely account of the true bugs of the Neotropical Region.

Bug Research Branch, Agriculture Canada

Plant bugs--Miridae, the largest family of the Heteroptera, or true bugs--are globally important pests of crops such as alfalfa, apple, cocoa, cotton, sorghum, and tea. Some also are predators of crop pests and have been used successfully in biological control. Certain omnivorous plant bugs have been considered both harmful pests and beneficial natural enemies of pests on the same crop, depending on environmental conditions or the perspective of an observer. As high-yielding varieties that lack pest resistance are planted, mirids are likely to become even

more important crop pests. They also threaten crops as insecticide resistance in the family increases, and as the spread of transgenic crops alters their populations. Predatory mirids are increasingly used as biocontrol agents, especially of greenhouse pests such as thrips and whiteflies. Mirids provide abundant opportunities for research on food webs, intraguild predation, and competition. Recent worldwide activity in mirid systematics and biology testifies to increasing interest in plant bugs. The first thorough review and synthesis of biological studies of mirids in more than 60 years, *Biology of the Plant Bugs* will serve as the basic reference for anyone studying these insects as pests, beneficial IPM predators, or as models for ecological research.

Advances in Insect Physiology PenSoft Publishers LTD

Insect Biodiversity: Science and Society brings together leading scientific experts to assess the impact insects have on humankind and the earth's fragile ecosystems. It examines why insect biodiversity matters and how the rapid evolution of insect species is affecting us all. Insects and related arthropods make up more than 50 percent of the known animal diversity globally, yet a lack of knowledge about insects is hindering the advance of science and society. This book explores the wide variety in type and number of insect species and their evolutionary relationships. Case studies offer assessments on how insect biodiversity can help meet the needs of a rapidly expanding human population, and also examine the consequences that an increased loss of insect species will have on the world. The book concludes that a better understanding of the biology and ecology of insects is the only way to sustainably manage ecosystems in an ever changing global environment.

A primary aim of this catalog is to offer an accounting for each species as originally proposed and for the first usage only of all its name combinations (including valid names, synonymies, and misspellings) that have been published for our area. We follow the policy outlined by the 1985 Code of Zoological Nomenclature for nonnomenclatorial proposals that a dissertation for an advanced educational degree is not published unless it satisfies the criteria present in Articles 8 and 9.
