The first volume in the Urgent Matters series, Trojan Goat: A Self-Sufficient House traces the design and construction of the University of Virginia's whimsically named, award-winning entry in the 2002 U.S. Department of Energy Solar Decathlon. John D. Quale, the architectural advisor and coordinator for the project, provides here a firsthand account of the creation of the 750 square-foot solar-powered house. Aiming to make the remarkable achievements of the project better known, while highlighting potential future applications for the practice of architecture, Trojan Goat provides an exciting moment-to-moment documentary of the making of this environmentally friendly house. Designed and built by a team of students and faculty from the School of Architecture and the School of Engineering and Applied Science, the house combines the use of sustainable materials with thoughtful design and technological innovation. According to the received statistics, building use accounts for one-half of the total energy burnt each year in the United States, a greater amount by far than that consumed per annum by automobiles. Quale argues that, based on statistics such as these and the positive reception of Trojan Goat, there should be greater support for sustainable building practices in the United States, including an increase in design-build opportunities for students of architecture.

The Book of the Goat in its original edition was the first work devoted to the subject printed in the English language. First published in London in the 1880s, it is now a very scarce and desirable book in any early edition. This edition had been considerably revised and enlarged giving many more pages of comprehensive information on this popular animal. Three hundred and sixty six pages contain twenty nine detailed chapters: Origin and Early History of the Goat; Varieties of Goats; British Milch Goats; Continental Milch Goats; Oriental and African Goats; The Angora or "Mohair" Goat; The Cashmere or "Shawl" Goat; Cross Bred Goats; Selecting a Milch Goat; Housing; Pasturing; Stall Feeding; Breeding; Rearing Kids; Milking; Goats' Milk; Its Virtues and Utilities; Goats' Butter and Cheese; The Flesh of the Goat; Other Products; The Goat as a Foster Mother; He-Goats and Goat-Carriages; Goat Farming; Shows and Showing; The British Goat Society; Goats and the Malta Fever; Diseases, Parasites, etc; Dishorning; Preventing Growth of Horns; Breeding Hornless Goats. etc. Since this book was first published the advance in goat keeping has been most marked. The improvement in the culture of the goat as a source of milk, fleece and meat has been manifest not in England alone, but globally. This historical record will be of major interest to goat keepers worldwide, with much of its content remaining relevant even to this day.

Les changements climatiques ont un impact sur la biosphère, causant notamment des extinctions d'espèces, des changements d'aire de répartition, des effondrements d'écosystèmes et des modifications de comportement. Ces impacts sont susceptibles d'être exacerbés à mesure que les changements climatiques continuent de s'accélérer. Pour prédire les impacts des changements projetés sur la faune, nous devons comprendre comment la météo influence le comportement des espèces. En Amérique du Nord, les précipitations et la température devraient augmenter au cours des prochaines décennies, en particulier aux latitudes et altitudes élevées. Les chèvres de montagne (*Oreamnos americanus*), comme de nombreux ongulés nordiques, risquent d'être affectées négativement par des températures estivales plus chaudes. Le but de mon projet est de comprendre comment les conditions environnementales estivales influencent le comportement et la sélection d'habitats des chèvres de montagne afin de mieux comprendre les impacts futurs des changements climatiques. Nous avons émis l'hypothèse que les températures estivales élevées incitent les chèvres de montagne à utiliser des tactiques d'évitement de la chaleur telles que l'utilisation de microsites frais (haute altitude, zones boisées, microsites enneigés et habitats ombragés) et à réduire leur activité pendant la période la plus chaude de la journée. Nous avons également émis l'hypothèse que les tactiques d'évitement de la chaleur utilisées par les chèvres dans les environnements côtiers et continentaux sont différentes, les chèvres en milieu côtier utilisant des altitudes plus élevées lorsque la température augmente et les chèvres en milieu continental utilisant des zones boisées et ombragées. Nous avons analysé l'influence des conditions météorologiques estivales, en particulier la température, sur les modèles d'activité et la sélection de l'habitat de quatre populations de chèvres de montagne représentant les deux écotypes observés chez cette espèce, côtier et continental. Les chèvres de montagne des deux écotypes ont utilisé des tactiques différentes pour éviter la chaleur dans leur sélection d'habitats. Les chèvres de montagne des milieux côtiers ont sélectionné des habitats ouverts proche de la neige, tandis que les chèvres des sites continentaux ont sélectionné les milieux forestiers lorsque la température augmentait. Les chèvres de montagne dans les environnements continentaux ont choisi des habitats à plus haute altitude plus souvent que ceux en basse altitude uniquement lorsque la température augmentait, tandis que les chèvres dans les environnements côtiers ont choisi des habitats à plus haute altitude à toutes les températures. Les chèvres de montagne des deux écotypes ont réduit leur proportion de temps passé actif lorsque les températures augmentaient au milieu de la journée, mais l'activité à l'aube et au crépuscule n'était pas

influencée par la température. Notre étude montre que les chèvres de montagne utilisent une série de tactiques différentes pour éviter le stress thermique. Nous montrons également que les chèvres de montagne vivant dans différents écosystèmes utilisent des tactiques alternatives et sont affectées par le changement climatique de manière différente. Nos résultats soulignent l'importance d'évaluer l'impact des changements climatiques au niveau de la population plutôt qu'au niveau de l'espèce, car les espèces ne sont pas un assemblage homogène de populations et les populations subissent des contraintes environnementales différentes selon le milieu qu'elles habitent.

Automne 1978, nord de la Californie. C'est l'ouverture de la chasse sur les deux cent cinquante hectares du ranch de Goat Mountain où un garçon de onze ans, son père, son grand-père et un ami de la famille se retrouvent comme chaque année pour chasser. À leur arrivée, les quatre hommes aperçoivent au loin un braconnier qu'ils observent à travers la lunette de leur fusil. Le père invite son fils à tenir l'arme et à venir regarder. Et l'irréparable se produit. De cet instant figé découle l'éternité : les instincts primitifs se mesurent aux conséquences à vie, les croyances universelles se heurtent aux résonances des tragédies. Et le parcours initiatique du jeune garçon, abandonné à ses instincts sauvages, se poursuivra pendant plusieurs jours, entre chasse au gibier et chasse à l'homme.
