The Paradoxical Brain focuses on a range of phenomena in clinical and cognitive neuroscience that are counterintuitive and go against the grain of established thinking. The book covers a wide range of topics by leading researchers, including: • Superior performance after brain lesions or sensory loss • Return to normal function after a second brain lesion in neurological conditions • Paradoxical phenomena associated with human development • Examples where having one disease appears to prevent the occurrence of another disease • Situations where

drugs with adverse effects on brain functioning may have beneficial effects in certain situations A better understanding of these interactions will lead to a better understanding of brain function and to the introduction of new therapeutic strategies. The book will be of interest to those working at the interface of brain and behaviour, including neuropsychologists, neurologists, psychiatrists and neuroscientists.

"The definitive reference for budding and experienced cancer epidemiologists alike." -American Journal of Epidemiology
"Practitioners in epidemiology and oncology will find immense value in this." -JAMA Since its initial publication in 1982, CANCER EPIDEMIOLOGY AND PREVENTION has served as the premier reference work for students and professionals working to

understand the causes and prevention of cancer in humans. Now revised for the first time in more than a decade, this fourth edition provides a comprehensive summary of the global patterns of cancer incidence and mortality, current understanding of the major causal determinants, and a rationale for preventive interventions. Special attention is paid to molecular epidemiologic approaches that address the wider role of genetic predisposition and gene-environment interactions in cancer etiology and pathogenesis. New and timely chapters on environmental and social-epidemiologic factors include: · The role of social class disparities · The role of obesity and physical inactivity · The potential effects of electromagnetic fields and radiofrequency radiation · The principles of cancer chemoprevention For both seasoned professionals and newer generations of students and researchers, this fourth edition of *CANCER EPIDEMIOLOGY AND PREVENTION* remains the authority in the field -- a work of distinction that every lab, library, student, professional, or researcher should have close at hand.

Epidermolysis bullosa (EB) is the collective term for a heterogenous group of genetic skin disorders characterised by the formation of blisters and erosions on skin and mucous membranes. This book deals with early childhood motor and perceptual development, a particular challenge for children with extremely fragile skin. Going into functional treatment, it

addresses rehabilitation of hands and feet in EB patients with fusions or contractures. The authors are occupational therapists with long-term experience in the management of EB patients. In an extraordinary holistic approach, they present a combination of paediatric and functional areas of treatment. Occupational therapy tools and interventions can help alleviate a number of accompanying complications and symptoms of EB, enhance self-care, and improve quality of life in general. Due to its practical approach, this book not only serves as a unique guide for doctors and health care professionals but is also comprehensible and useful for patients.

The American Psychiatric Publishing Textbook of Geriatric Neuropsychiatry Elsevier

Written by an intensivist familiar with ultrasound, this book describes a new clinical tool: ultrasound for the intensive care and emergency physician. Cancer Epidemiology and Prevention Springer

Introducing the book that bridges the gap between a dermatologic surgery textbook and a dedicated flap and reconstructive guide *Dermatologic Surgery* is a unique resource that offers the benefits of both a single-volume multi-author global dermatologic surgery textbook and a dedicated flap and reconstructive reference. Conveniently organized by flap type as well as regional approach, it offers by far the most comprehensive flap and reconstruction sections of any general

dermatologic surgery book. The book's content breakdown attempts to reflect the proportion of time, effort, and training required for a given subject. For example, there are five full chapters (in addition to numerous other sections) dedicated to Mohs surgery. Similarly, a total of 17 richly illustrated chapters, including those devoted to particular flap techniques and regional approaches to reconstruction, address flap and graft closures. Since anatomy is the foundation on which all surgery is built, the anatomy chapter was built on a true ground-up cadaveric study of head and neck anatomy with an eye to clinical relevance. Full-length high-quality videos are an essential adjunct to learning procedural techniques, and this text includes the largest video resource of its kind ever compiled. This coupled with almost 3,000 high-quality clinical photographs and nearly 500 professional medical illustrations, including infographics with surgical pearls for each chapter – many bolstered by beginner tips, expert tips, cautions, patient education points, and even billing tips – make this a true primer for real-world skin surgery practice.

Imaging of Pulmonary Infections McGraw Hill Professional

It encompasses the classical methods of morphology such as the clinical and dermoscopic examination and dermatopathology. The book also deals with the most up-to-date diagnostic approaches such as laser scanning in-

vivo microscopy and automated diagnosis. The visual 'atlas' includes superb clinical, dermoscopic and histopathologic images.

Dermoscopy is a noninvasive skin imaging technique that uses optical magnification and either liquid immersion or cross-polarized lighting to make subsurface structures more easily visible when compared to conventional clinical images. It allows for the identification of dozens of morphological features that are particularly important in identifying malignant melanoma. *Dermoscopy Image Analysis* summarizes the state of the art of the computerized analysis of dermoscopy images. The book begins by discussing the influence of color normalization on classification accuracy and then: Investigates gray-world, max-RGB, and shades-of-gray color constancy algorithms, showing significant gains in sensitivity and specificity on a heterogeneous set of images Proposes a new color space that highlights the distribution of underlying melanin and hemoglobin color pigments, leading to more accurate classification and border detection results Determines that the latest border detection algorithms can achieve a level of agreement that is only slightly lower than the level of agreement among experienced dermatologists Provides a comprehensive review of various methods for border detection, pigment network extraction, global pattern extraction, streak detection, and perceptually significant color detection Details a computer-aided diagnosis (CAD) system for melanomas that features an inexpensive acquisition tool,

clinically meaningful features, and interpretable classification feedback Presents a highly scalable CAD system implemented in the MapReduce framework, a novel CAD system for melanomas, and an overview of dermatological image databases Describes projects that made use of a publicly available database of dermoscopy images, which contains 200 high-quality images along with their medical annotations *Dermoscopy Image Analysis* not only showcases recent advances but also explores future directions for this exciting subfield of medical image analysis, covering dermoscopy image analysis from preprocessing to classification.

This book covers a wide array of hematologic problems commonly encountered in the daily practice of critical care and emergency medicine. Unfortunately, the symptoms and signs associated with underlying hematologic disorders are frequently rather unspecific and confounding; furthermore, the clinical course of patients admitted to intensive care units with such disorders can be fulminant, warranting prompt diagnosis. This book recognizes the importance of accurate and speedy interpretation of symptoms in that the text is symptom oriented rather than disease oriented. Put another way, the reader confronted with a particular clinical problem or symptom will be guided step by step to the possible underlying disorder(s). The scenarios considered include critical illness in patients with anemia, leukopenia, leukocytosis, abnormal platelet count, and severe transfusion reactions. For each circumstance, factors relevant to symptom interpretation are fully discussed. In addition, helpful diagnostic algorithms are presented in the form of flow charts that will assist in decision making regarding the need for further investigations. The closing chapter is devoted to the drug-induced hematologic disorders. Although the book is intended mainly for intensivists, other specialists will find much information of value for their daily practice.
