This book introduces the basic inferential patterns of formal logic as they are embedded in everyday life, information technology, and science. It is designed to make clear the basic topics of classical and modern logic. The aim is to improve the reader's ability to navigate both

everyday and science-based interactions. *Life Sciences* World Health Organization This book aims to provide an excellent overview of the differential diagnosis and approach to chest pain in various clinical settings. This book is divided into two sections including the introduction and the approach to chest pain. Our introductory chapter starts with the basic principles of statistics and its application in various diagnostic modalities of heart disease. Our authors present a nice approach to patients presenting with chest pain in various scenarios. We have also included a

chapter describing GERD, which could present as chest pain and another chapter describing aortic dissection, which is a life-threatening disease presenting with chest pain. We hope that this book will serve as an accessible handbook on the differential diagnosis of chest pain.

NEW YORK TIMES BESTSELLER • This instant classic explores how we can

change our lives by changing our habits. NAMED ONE OF THE BEST BOOKS OF THE YEAR BY *The Wall Street Journal* • *Financial Times* In *The Power of Habit*, award-winning business reporter Charles Duhigg takes us to the thrilling edge of scientific discoveries that explain why habits exist and how they can be changed. This book provides a detailed overview of the current state of knowledge regarding the pathophysiology of both primary headaches - migraine, tension-type headache (TTH), and cluster headache - and the very important and frequent type of secondary headache, medication overuse headache (MOH). After an introductory chapter describing relevant neuroanatomy and vascular anatomy, the evidence gained from animal models regarding the pathophysiology of migraine and the other primary headaches is reviewed. Knowledge of the genetic component in the different types of

headache is then examined with reference to recent evidence, for example regarding the implication of the trigeminovascular system and cortical spreading depression in migraine. Detailed information is provided on insights into primary headaches from imaging studies, including functional magnetic resonance imaging and positron emission tomography and on their neurophysiology and biochemistry. A further series of important chapters describe present knowledge of the pathophysiology of each specific type of headache and consider future directions. Written by acknowledged experts in their fields from Europe and the United States, clinicians and students will find *Pathophysiology of Headaches* to be an excellent source of up-to-date information on why patients experience headaches. In addition, it will be of value for pain researchers investigating the underlying mechanisms of headache.

The fascinating story of Ignaz Semmelweis, a nineteenth-century obstetrician ostracized for his strident

advocacy of disinfection as a way to prevent childbed fever In *Genius Belabored: Childbed Fever and the Tragic Life of Ignaz Semmelweis*, Theodore G. Obenchain traces the life story of a nineteenth-century Hungarian obstetrician who was shunned and marginalized by the medical establishment for advancing a far-sighted but unorthodox solution to the appalling mortality rates that plagued new mothers of the day. In engrossing detail, Obenchain recreates for readers the sights, smells, and activities within a hospital of that day. In an era before the acceptance of modern germ science, physicians saw little need for cleanliness or hygiene. As a consequence, antiseptic measures were lax and rudimentary. Especially vulnerable to contamination were new mothers, who frequently contracted and died from childbed fever (puerperal fever). *Genius Belabored* follows Semmelweis's awakening to the insight that many of these deaths could be avoided with basic antiseptic measures like hand washing. The medical establishment, intellectually unprepared for Semmelweis's prescient hypothesis, rejected it for a number of reasons. It was

unorthodox and went against the lingering Christian tradition that the dangers of childbirth were inherent to the lives of women. Complicating matters, colleagues did not consider Semmelweis an easy physician to work with. His peers described him as strange and eccentric. Obenchain offers an empathetic and insightful argument that Semmelweis suffered from bipolar disorder and illuminates how his colleagues, however dedicated to empirical science they might have been, misjudged Semmelweis's methods based upon ignorance and their emotional discomfort with him. In *Genius Belabored*, Obenchain identifies Semmelweis's rightful place in the pantheon of scientists and physicians whose discoveries have saved the lives of millions. Obenchain's biography of Semmelweis offers unique insights into the practice of medicine and the mindsets of physicians working in the premodern era. This fascinating study offers much of interest to general readers as well as those interested in germ theory, the history of medicine and obstetrics, or anyone wishing to better understand the trajectory of modern medicine.

From one of our most important scholars and civil rights activist icon, a powerful study of the women's liberation movement and the tangled knot of oppression facing Black women. "Angela Davis is herself a woman of undeniable courage. She should be heard."—The New York Times Angela Davis provides a powerful history of the social and political influence of whiteness and elitism in feminism, from abolitionist days to the present, and demonstrates how the racist and classist biases of its leaders inevitably hampered any collective ambitions. While Black women were aided by some activists like Sarah and Angelina Grimke and the suffrage cause found unwavering support in Frederick Douglass, many women played on the fears of white supremacists for political gain rather than take an intersectional approach to liberation. Here, Davis not only contextualizes the legacy and pitfalls of

civil and women's rights activists, but also discusses Communist women, the murder of Emmitt Till, and Margaret Sanger's racism. Davis shows readers how the inequalities between Black and white women influence the contemporary issues of rape, reproductive freedom, housework and child care in this bold and indispensable work.

What We Hold in Common Independently Published

The compartmentation of genetic information is a fundamental feature of the eukaryotic cell. The metabolic capacity of a eukaryotic (plant) cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus/cytosol, plastids, and mitochondria. Alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism. Although the biological significance of this genetic design has been vividly evident since the discovery of non-Mendelian inheritance by Baur and Correns at the beginning of this century, and became indisputable in principle after Renner's work on

interspecific nuclear/plastid hybrids (summarized in his classical article in 1934), studies on the genetics of organelles have long suffered from the lack of respectability. Non-Mendelian inheritance was considered a research sideline~if not a freak~by most geneticists, which becomes evident when one consults common textbooks. For instance, these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria, of metabolism and global circulation of the biological key elements C, N, and S, as well as of the organization, maintenance, and function of nuclear genetic information. In contrast, the heredity and molecular biology of organelles are generally treated as an adjunct, and neither goes as far as to describe the impact of the integrated genetic system.
